

Step 2 — Ask Claude to Create the Website Front-End Design Page

You do not manually create or code anything. Instead, instruct Claude to:

- Create a new HTML file named **Frontend.html**
- Include a header section with the title **FrontEnd**

Add input fields for:

- Idea
- Theme
- Products

Include:

- A **Generate Now** button that sends the inputs to Claude
- Integration with [kie.ai](https://kier.ai) so prompts are automatically sent and images are returned
- Persistent storage so all prompts are saved and remain after refresh

Claude handles all setup, generation, and integration.

Step 3 — Provide Design Requirements to Claude

You now instruct Claude to generate design concepts.

Important: These are moodboards of homepage designs, not working websites.

Requirements for Claude:

Generate **six unique website homepage design concepts as images:**

- 2 Minimalist
 - Clean
 - Whitespace-forward
 - Restrained palette
- 2 Contemporary
 - Modern design trends
 - Expressive but professional
- 2 Dynamic
 - High contrast
 - Bold typography

- Visually striking layouts

For each design, include:

- Style category
- Concept name
- A concise description of the visual direction
- A **front image prompt** (homepage layout)
- A **back image prompt** (inner sections or supporting visuals)

Ensure:

- All designs follow the same **Idea, Theme, and Products**
- Prompts are saved and persist on refresh
- You only provide inputs
- Claude generates everything else

Concept Generator Setup

Your concept generator needs to be set up for this exercise. Make sure it meets these requirements:

- It should generate **front-end website designs** (full page layouts, not just color/font moodboards)
 - If yours only generates moodboards, ask Claude to update it so it outputs complete website UI designs
- It should have an **"image prompt" feature** that saves the design description text
 - This allows Claude to remember and refine designs later
 - If missing, ask Claude to add it
- It should **export designs as HTML files**
 - If it doesn't have an export/download feature, ask Claude to add a button that saves the current design as a downloadable **.html** file

Once your generator is ready:

- Create a design you like
- Download it as an HTML file

Sample Expected Data Input:

AI DESIGN GENERATOR

Mood Board Generator

01 — MINIMALIST

02 — TRENDY

03 — BOLD / EDITORIAL

Powered by Gemini 2.0 Flash 5 kle.ai GPT-4o Image

DESIGN BRIEF

Describe your website — we'll generate 6 concepts across 3 style directions with live AI mockups.

WEBSITE CONCEPT

Required

e.g. A community platform for Filipino divers to share spots and trips

VISUAL THEME

Required

e.g. ocean, adventure, tropical, dark tech

KEY SECTIONS

Optional

e.g. Hero, Community Feed, Events, Map

GENERATE MOODBOARD

TEST API CONNECTION

Sample Expected Output:

Step 4 — Generate Images Through Claude

Instruct Claude to generate images via [kle.ai](https://www.kle.ai) using the prompts it created.

Important:

- Use your existing [kie.ai](#) API key
- Do **not** use Gemini or Anthropic tools
- Claude handles all prompt submissions
- Images are returned directly to the Moodboard page

You review images **inside the page**, not inside [kie.ai](#).

Step 5 — Review and Iterate

Each design concept must include:

- Design number
- Style category
- Concept name
- Description
- Generated images

You can:

- Ask Claude to refine a concept
- Adjust prompts
- Regenerate images

No manual editing is required.

Final Clarification

This task is about generating **multiple homepage design directions as moodboards**.

You are NOT:

- Building a website
- Creating one final design

You ARE creating:

- 6 different visual directions
- 6 homepage-style moodboards
- 6 ways the same website could look before development

Each image should clearly feel like a **real homepage design concept**, not random visuals.
